Calibration Procedure

Standard Site Method

Calibration of the antenna factor is carried out on the Reference Open-Area Test Site using the standard-site method based on CISPR 16-1-6 and ANSI C63.5 where the antenna factor is derived from the site attenuation measurement of three antennas. At the terminal of each antenna an attenuator is inserted in order to minimise the mismatch.

The gain is calculated from the antenna factor using the equation 8 from SAE ARP 958.

The voltage reflection coefficient (VRC) is measured using a network analyser. Results are shown as voltage standing wave ration (VSWR) calculated from the voltage reflection coefficient as following:

$$VSWR = \frac{1 + VRC}{1 - VRC}$$

Calibrations are carried out as described in internal working procedures of the ISO 9001 certified quality management system. All relevant additional ports of the device under test are terminated.

Accuracy of Calibration

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $k = 2$, which for a normal distribution corresponds to a coverage probability of approximately 95%. The standard uncertainty of measurement has been determined in accordance with EAL Publication EA 4/02.
